Domain Info Mapper

Your Key to Value-Critical Information

In today's complex product development landscape, ineffective information management is a major obstacle to success. Most companies have product management systems in place to manage technical information, but value-critical information requires a different approach.

Navigate the Forest of Information with Confidence

Domain Info Mapper is designed to help you manage value-critical information, ensuring it remains a thread throughout your development project.

Our app explains the five essential information domains that drive customer value: Customers, Needs, Functions, Solutions, and Processes.

Using AI to interpret text, Domain Info Mapper identifies which information domains a sentence

contains, preventing information mix-ups and ensuring clarity.

Domain Info Mapper provides a structured approach to analyzing complex sentences and creating key insights. It helps users and teams understand what information needs to be managed in a development project and how to structure it.

Domain Info Mapper provides:

- Clear understanding of the five information domains that drive customer value
- AI-powered analysis to identify value-critical information in your sentences and its relevance to the five domains
- Turning unclear requirements into concise and understandable language
- Enhanced understanding of what drives customer value.

Take Control of Value-Critical Information.

Domain Info Mapper

Type a sentence and discover which information domain(s) it belongs to — from **Customers** and their **Needs**, through abstract **Functions**, to concrete **Solutions** and **Processes**. Classify and compare up to eight sentences side by side.

e.g. 'Small business owners struggle with invoicing and need a simple tool.'
